Project Overview

This project was cad modeling work and hopefully 3d print this project was done with onshape in my drafting class. The project work was with many parts and also done with a github.

Why?

I want to get more experience working with my modeling software. Also I think it would be a fun project to do more with driving constraints and mates.

how

Don't like making second parts and part Studios and then combining it into an assembly after I got one side working I then cloned that over to the other side creating a successful duplicate with a mirror mate setup this made it so I did not have to redo everything after that I made a shell and I even had enough space for a shelf in the bottom which was a

lot of fun.

conclusion

This is a very good project. I gained a lot of experience had a good time and would love to do this again with something else perhaps trying to make this actually function a bit more complex besides just three Printing and trying to Model A real one stroke engine.
