Project Overview

This project was done to test my Arduino coding skills and to be able to Simply blink an LED. It wasn't going to be anything super technical but it would be enough to test my processors, my computer and my IDE as well as getting me into the environment.

Why?

This project was done once again just to test my computer, my IDE and my environment and because I wanted to test my cable which I had suspicions about.

how

This was done via some basic IDE code and simply flashed to an Arduino. There is not much explanation required. This was one of my first projects..

conclusion

Although basic this was a key project in my development because it opened me up to being able to code LED is and understand the basic concepts necessary for these projects.
