Project Overview

I created a very realistic blender simulation in order to test my computer's and my capabilities at rendering high polygon complex physics rendering such as a where 512,000 subdivision cloth onto a basic Taurus

Why?

I needed to test my PCS limits and I wanted to test my own skills at blender given just a day of learning it.

how

I created a basic plan and subdivisions gave it the physics of a cloth and gave a collision after that I made your self-collision was on at the quality testing of 25 and then I gave the basic Taurus and the basic Cube both Collision detection this would keep them in place but let the cloth drape over them.

conclusion

My PC is probably very angry at me now but it is functional and the concepts do work I have now understood blenders physics and my PC's strength and weakness
