Project Overview

I created a very basic digital Pat on an Arduino Mega board connected to a 3.5 in display. This was the test of 3.5 inch displays and their ability to reload animations for another project called the slot bot.

Why?

I needed a test both of my Arduino Mega and my 3.5 inch display and figured this would be a good way to do both of the same time as well as the fact I'd like to anticipate some miniature Tamagotchi aspect into my project

how

this project was coded in Arduino IDE was a lot of fun and overall made sense

conclusion

Both the board and the 3.5 inch display work their animation reloader speed is suboptimal but it will serve for my purposes. will continue working on my project as planned must do CAD for slot now
