## Project Overview

This project was done working on the cape and I was trying to create a bug spray flamethrower design to test different things. it took me a tiny bit but it was worth it and was very functional

### Why?

This was done to learn more about chemistry and how basic chemicals are flammable and not flammable. It took a while but I believe it was very worth it.

### how

This was done using a basic lighter with an extension and some bug spray then I made it so that I could set it off from further away to make it safe and I got a powerful fire showing how dangerous bug spray and things like that can truly be in the wrong use

## conclusion

This project was very fun and one of my first experiences with understanding chemistry and how different things light on fire. It took me a while to get it right but once I did I had a really good time and realized I could apply it to make a lot of things go on fire.
