Project Overview

I did this project to create a working AI bot that could run locally on my 4050 nvidia Graphics card this way I could experience AI that I actually created and modify it using different prompts and coding

Why?

AI that I actually created and modify it using different prompts and coding actually I wanted to test my abilities and my skills by By creating my own python tokenizing code and using system command prompt in order to do most of the other stuff

how

This would utilize Python and command prompt from Windows. This would be challenging as I would need to create multiple different programs and file

directory coding which I have no experience with.

Conclusion

the GPT model worked as I started working on GPT too as it was commonly available and would serve my goal I could ask it questions and it would give me coherent answers, be able to quotes iconic media and do basic coding (named jarvis)

```
25.3 -> 26.0.1
install --upgrade pip

jarvis.py
JarvisBot\jarvis.py': [Errno 2] No such file or directory

s_env
s
es free

Users\sebas\JarvisBot
env\Scripts\activate
```
