Project Overview

This was learning how to use blender and use it for more complex projects such as proportional editing and things similar to that. This meant I had to learn more things and at some point I had to run modifiers and different complexes subdivision shapes.

Why?

My robotics team (2877) required me to learn blender as I stepped up in order to make these trinket designs so going to worlds would be tricky but I managed to do it.

how

I used what I learned on blender to create more complicated and better shapes and inset to make the geodes appear good. Then I had to do sculpting to add details and blemishes to make it better. I also needed to make sure the slicer could do the geometry for 3d printing and mass production.

conclusion

This project went well and now blender has become part of my toolkit with solid knowledge. Although I have not animated yet I understand the software and the physics engine. The most difficult part of this was fixing bugs in the slicer and learning the weird mechanics of
