Project Overview

This project was done in onshape using the custom sketch tool and the parts from the FRC Library. This was done to create the robot design for this year's FRC robot of 2026. I worked on a few parts involving checking the stability and fastens of it. Also designed basic and complex

mechanisms for the indexing mechanism and for the shooter mechanism. This process was, although tedious, very fun and I learned a lot.

Why?

This was done because we needed to first cat a robot before we could create it physically for the FRC 2026 season. This season focused around shooting balls into a hopper which made accuracy, shooting speed and capacity top priorities.

how

This was done using on shapes custom part feature which we used a lot of and on top of that the slightly more complicated FRC libraries of supplies so that we knew what we could basically work with to figure out gear ratios and things like that.

Conclusion

The project went very well. The robot works exactly as it should and although innovations are happening, basic design is done and simply we need to optimize now.
