Project Overview

This project was done by me in my robotics class where we built a remote control robot capable of loading and firing tennis balls . This was my robotics 1 project and went pretty well. I built a system called the artemis which utilized elastic potential energy to fire the cannon with much more strength.

Why?

This was done to learn more about machining and customizing parts such as tapping. The whole experience was a good way to learn about the different robotic processes such as design and the documentation process.

how

This was done via a basic kit we first assembled then we had to work on innovating it to get a claw onto it. This was done via a servo and a bunch of modifications to a basic catapult design. This took

most of the classes

conclusion

This project was a relative success and we were able to get a working version before the end. It took a bit of work to get there but we managed to get it done. In the future I will remember the power of an elastic energy and basic physics ways for easier setup.
