Project Overview

I hooked the basic motor up to a 12 volt power supply and added it to a CD disc with sandpaper on top to create a basic sanding machine that I could use to effectively sand down projects.

This would be a good test of my cad skills and my 3D printer tolerances. I guess they had not been tested yet as this was an earlier project.

Why?

This was done because I did not want to spend ridiculous last time sanding down wooden projects. I wanted an easier tool to do it without having to pay a solid amount of money while using my skill set.

how

The Machine was created in tinkercad creating a simple box and then booleaning it together with a hollow motor. After that I simply added a base layer and added a place for wires to go in and a switch. I simply added the motor, the sanding disc I had

created and the chords and Battery when I was done.

conclusion

This project worked very well and saved me a solid amount of time on soldering although there was a slight weight and balance which caused some basic vibrations but this was handled mostly and is decent.
