Project Overview

This project started with some pretty basic process of trying to make stickers for my business without tools or professional Cutters. When I started with it I bought printable inkjet sheets that I could load into my printer. Then I modified the printers settings to be able to print on the final

and then created special sticker Silhouettes and figured out how to efficiently cut those out creating stickers once I did this I simply packaged them up

Why?

I wanted to create something that would have a low cost to make that I could give out to customers to show gratitude for their purchase, increasing the bond and making it more likely for them to buy from me.

how

That's why adjusting my printer settings to be able to print on vinyl sticker paper and then cutting them out

manually and putting them in tiny envelopes went very well.

conclusion

This project went very well. Although it did go well I believe in the future I will be contacting commercial manufacturing for better work and not having to spend the ridiculous amount of time cutting them into sheets.
