Project Overview

I used a basic Transformer To create a taser module I wanted this so I can finally have the power of lightning between my hand it's been a dream for quite a while now and if I ever wanted to do the Iron Man suit I would need this high voltage for different parts of the suit such as

combustion chamber Cannon

Why?

I have always wanted to do this but this is also necessary for both the combustion chamber and electricity principles of the Iron Man suit

how

I accomplish this by buying a cheap Transformer putting it to use by attaching a 9-volt battery into electrodes

conclusion

This experiment works with a lot of fun and I will

have to use this in later tests
