Project Overview

Made this project as a basic web server to test the ESP 32s capabilities at making websites and Wi-Fi based sites.

Why?

As I intend on doing more things with esp32 I must test their capabilities and test the own capabilities of my skill sets and this was an excellent way to do that

how

I use the basic ESP 32 microcontroller encoded it in Arduino IDE to make rudimentary web server that I could access from my computer

conclusion

I am very ready for my next ESP 32 projects and mostly understand how to create different web

servers websites and things like that, meaning I will be ready for testing its Bluetooth capabilities which will be the follow-up .
